CSCE 747 - Loop Testing Activity Name(s):

1. Draw the control-flow graph for the following code:

```
void Binary_search (elem key, elem* T, int size, boolean &found, int &L) {
      int bott, top, mid;
      bott = 0;
      top = size-1;
      L = 0;
      if(T[L] == key) {
             found = true;
      }else{
             found = false;
      while (bott <=top && !found) {
             mid = round((top + bott) / 2);
             if(T[mid] == key) {
                    found = true;
                   L = mid;
             } else{
                    if (T [mid] < key ){
                          bott = mid + 1;
                    }else{
                          top = mid-1;
      } // while
} //binary_search
```

2.	Identify the subpaths through the loop and draw the unfolded CFG for boundary interior testing.
3.	Write a test suite that achieves loop boundary coverage (That exercises the loops: - Zero times - One time
	- Two or more times)
